Summary

Backend & AI Engineer with production experience building systems that connect LLMs, APIs, and live data sources into reliable, scalable services using Python and FastAPI. Specialized in multi-agent orchestration, LLM integration, and automated evaluation pipelines deployed in real-world environments. Experienced owning backend services end-to-end — from API design and integrations to deployments, monitoring, and CI/CD. Comfortable working independently in fast-paced, early-stage environments and translating complex business problems into practical technical solutions.

Skills

- Programming:** Python (primary), SQL, JavaScript, TypeScript
- Backend Development:** FastAPI, REST APIs, microservices, service-layer architecture, structured validation, JWT, RBAC, SSE (real-time streaming)
- AI & LLM Systems:** LLM integration (OpenAI APIs), multi-agent orchestration, tool use, prompt engineering
- AI Evaluation:** MLflow evaluation pipelines, LLM-as-a-judge, automated response validation
- Data & Integrations:** SQL Server, structured data pipelines, inter-service API integration, data integrity enforcement, time-series data handling
- Infrastructure & Tools:** Docker, GitHub Actions (CI/CD), Linux, SSH, Git, remote server debugging, Azure (cloud deployment)
- Languages:** Spanish (native), English (upper-intermediate, B2)

Experience

- | | |
|--|--------------------------------|
| IBICARE , Backend & AI Engineer | Mexico |
| <ul style="list-style-type: none">- Built and owned production backend services using Python and FastAPI, connecting LLM agents with live biometric data and product APIs for a multi-role digital health platform serving 400+ users.- Developed multi-agent orchestration systems capable of delegating tasks, consuming APIs, and using tools to automate data analysis and decision-making workflows, handling 100+ daily AI-assisted requests.- Developed data connectors and structured ingestion pipelines for 300+ biometric records, enabling LLM tools to automate data interpretation and enforce integrity across the system.- Built internal observability platform tracking token consumption per user and company, tool usage patterns, and active device connections across the platform; maintained CI/CD pipelines via GitHub Actions.- Implemented JWT-based authentication and RBAC authorization to enforce secure, role-based access control over sensitive health data across multiple integrated products.- Designed MLflow-based LLM evaluation pipelines using LLM-as-a-judge methodology to assess agent response quality across intent, content, and safety dimensions. | Sep 2025 – present
8 months |

Education

- | | |
|---|---------------------|
| B.S. Instituto Tecnológico Superior de Apatzingán , Computer Systems Engineering | Michoacán, Mexico |
| Expected graduation: August 2026 | Ago 2021 – Ago 2026 |
